### Overview

The 702M12-W radio features a combination of powerful technologies that enable fast setup and optimized operation. Power over Ethernet (PoE) capability allows the 702M12-W to receive both power and data over a Cat5e cable from a PoE device\*, eliminating the need for additional cables or power supplies. For convenience, autosensing capabilities intuitively detect network speed and operation. The unit includes three antennas for Multiple-In, Multiple-Out (MIMO) performance, a smart antenna technology that maximizes throughput.

\*The N-Tron 105TX-POE switch is an excellent device for this application.

### Industrial Packaging and Specifications

The 702M12-W is specifically designed to operate in harsh industrial environments. With its rugged IP67-rated enclosure and industrial specifications, such as expanded tolerances to dust, wash down, vibration, temperature and EMI, plus redundant power inputs, the 702M12-W easily meets and exceeds the operating parameters of connected network equipment.

### Multiple Wireless Modes

The 702M12-W can be configured to suit specific application requirements.

**Station:** In **Station** configuration the 702M12-W is used to connect a single device (MAC Address) to a wireless access point.

**Station, WDS (Wireless Distribution System):** In **Station, WDS** mode the 702M12-W can be connected to a remote wired switch and will allow multiple devices (MAC Address forwarding) to be connected to the wireless access point with WDS activated.

**Access Point:** The **Access Point** configuration allows the 702M12-W to serve as a wireless switch for the attached wireless stations. Wireless access points are commonly used to create one wireless local area network (WLAN) that spans an area around the Access Point. Each access point typically supports up to 253 stations.

**Access Point, WDS (Wireless Distribution System):** The 702M12-W in **Access Point, WDS** mode allows wireless connection of a number of access points to extend the coverage of the wireless network. The main base Access Point in WDS mode is extended using a series of relay Access Points in WDS mode (Extended Service Set) and can in turn form a WLAN consisting of thousands of stations. All stations should be configured in **Station WDS** mode. Correctly configured switches will create a single network, providing station mobility throughout the wireless network.

### Multiple Network Modes

**Bridge:** The 702M12-W will operate in Layer 2 without network segmentation.

**Router:** The 702M12-W offers Layer 3 routing to allow network segmentation.

# 702M12-W Specifications

## Scenario 1 – Basic Bridge

Access Point:

The **Access Point** mode allows the 702M12-W to serve as a wireless switch for the wireless stations attached to it.

Station:

In **Station** configuration the 702M12-W is used to connect a single device (MAC Address) to a wireless access point.

For added security, the 702M12-W supports WEP, WPA™, and WPA2™. WPA and WPA2, TKIP (Temporal Key Integrity Protocol) and CCMP (Counter Mode with Cipher Block Chaining Message Authentication Code Protocol) are available.

## Scenario 2 – Control Network

In **Station WDS** mode the 702M12-W can be connected to a remote wired Ethernet switch with multiple devices connected to the switch.

# 702M12-W Specifications

## Scenario 3 – WDS Peering

In this scenario, each 702M12-W has been configured as a peer of selected other 702M12-W(s) by using the MAC Addresses of the select unit(s). This allows forklifts, or other mobile wireless devices, to maintain communication seamlessly as they move from the area covered by one 702M12-W into the area covered by the next 702M12-W.

## Scenario 4 – Broadband Modem Wireless Router (W/ DHCP)

When configured as a router, the N-TRON 702M12-W can act as a DHCP server. It supports Network Address Translation (Masquerade), a feature widely used by Access Points. This automates the assigning of IP addresses to devices as they connect. NAT will act as a firewall between LAN and WLAN networks. Additional firewall settings can be configured for Layer 3 packet filtering and access control in Router mode.
